

UNIVERSITY OF RUHUNA

Faculty of Engineering

End-Semester 5 Examination in Engineering: August 2015

Module Number: CE 5201

Module Name: Design of Steel Structures

[Three Hours]

[Answer all questions, each question carries 12 marks]

Code of Practice BS5950 Part 1 (2000) is provided

Q1. Briefly explain the followings.

- Advantages and disadvantages in use of steel as a building construction material.
- Properties and contents of "High strength steel" and "Mild steel"
- Web bearing and web buckling
- Factors that affect on lateral torsional buckling capacity of an un-restrained beam

[4x3 Marks]

Q2. A steel truss has been proposed to be used in a roof structure of a factory building. A design engineer has analyzed the truss for three load cases (i.e., dead, imposed and wind loads) by using a software. Resultant member forces for two critical web members and their lengths are summarized in Table Q2.

- Determine the design axial forces in the two critical web members at the ultimate limit state, considering all possible load combinations.

[3 Marks]

- It has been decided to use single equal angle section of 120x 120 x 10 of Grade S275 steel for these critical web members, which will be connected to gusset plates by two number of M20 bolts (Grade 8.8) in line along the angle.

- Determine the tensile capacity of the proposed section. Comment on its ability to carry the design tensile force at the ultimate limit state.
- Determine the compressive capacity of the proposed section. Is it sufficient to carry the design compressive force at the ultimate limit state?
- Discuss possible methods to improve compressive capacity of the section?

[9 Marks]

Q3. A mezzanine floor is required in a warehouse and is proposed to be constructed using steel sections as main beams and secondary beams (Figure Q3). The length of the main beam is 12 m. The main beam is expected to support uniformly distributed load of 5 kNm⁻¹ (factored) and two point load of 120 kN (factored) transferred from the secondary beams.

- Draw shear force and bending moment diagrams for the main beam and hence determine the design shear force and the design bending moment at the ultimate limit state.

[3 Marks]

- It has been proposed to use 533x210x92 UB section for the main beams and

356x171x45 UB section for the secondary beams. Both sections are in steel Grade of S275.

- i) Determine shear capacity and moment capacity of the section proposed for main beams. Hence determine whether the proposed section for main beams can withstand the design shear force and bending moment.
- ii) Check whether the web of the main beam will fail by web bearing and web buckling.

[9 Marks]

Q4. You were appointed as a junior design engineer and assigned for a task of designing a warehouse building, which consists of several portal frames. A typical portal frame was analysed for the ultimate load conditions using structural analysis software and found that a column of the frame (Figure Q4) was subjected to forces and moments as listed in Table Q4. The variation of major axis bending moment is linear along the length of the column.

Based on the experience, 305 x305x 97 UC section in Grade S275 steel is proposed. At supports, both flanges are restrained against rotation while the compression flange is laterally restrained.

- a) Classify the section into plastic, compact, semi-compact or slender.
[1 Mark]
- b) Determine the compressive capacity of the proposed section. Assume that both ends of the columns are effectively held in position and partially restrained in direction.
[3 Marks]
- c) Determine the moment capacity of the proposed section about the major axis.
[2 Marks]
- d) Determine buckling resisting moment, M_b , of the column, assuming loading condition is normal.
[3 Marks]
- e) Determine section capacity and overall buckling capacity of the proposed section.
[3 Marks]

Q5. A typical bolted bracket connection, is expected to carry a point load as shown in Figure Q5. The connection consists of 10 number of M20 bolts of Grade 8.8

- a) Identify, with justifications, whether the joint shown in Figure Q5 is rigid or flexible.
[3 Marks]
- b) Determine whether the bolt group arrangement shown in Figure Q5 can withstand the applied force and moment. Assume that the neutral axis of the bolt group is located 30 mm above the bottom flange level.

[9 Marks]

Table Q2

Member	Nodal length (m)	Axial force in member due to unfactored loads (kN)		
		Dead load	Imposed load	Wind load
Member 1	1.50	-200	-50	+100
Member 2	2.00	+120	+30	-60

Table Q4

Ultimate axial compressive force		400 kN
Ultimate bending moments about the major axis of the section	at the top	150 kNm
	at the bottom	75 kNm

Advance and UKA are trademarks of Corus. A fuller description of the relationship between Angles and the Advance range of sections manufactured by Corus is given on page A - 42.

These sections are in addition to the range of BS EN 10056-1 sections.

c is the distance from the back of the leg to the centre of gravity.

FOR EXPLANATION OF TABLES SEE NOTES 2 AND 3
