

UNIVERSITY OF RUHUNA

BACHELOR OF SCIENCE (GENERAL) DEGREE LEVEL III (SEMESTER II)
EXAMINATION – JANUARY 2018

SUBJECT: BOTANY

COURSE UNIT: GENETIC ENGINEERING AND BIOTECHNOLOGY (BOT 3271)

Time: One hour and thirty minutes (1.5 h)

Index No.:

Answer ONLY two questions (2) including question no. (1)

(1). Answer all questions.

(i) Define following terms.

Forward genetics:

.....

.....

.....

Reverse genetics:

.....

.....

.....

Recombinant DNA (rDNA):

.....

.....

Recombinant DNA (rDNA) technology:

.....

.....

.....

(ii) What are restriction enzymes and what is their role in nature?

.....

.....

.....

.....

.....

(iii) What information you could obtain from the name of '*EcoRI* restriction enzyme?

.....

.....

.....

.....

.....

(iv) What is the role of restriction enzymes in recombinant DNA technology?

.....

.....

.....

.....

.....

(v) What do you understand by 'sticky' and 'blunt' ends of a DNA fragment resulting after a restriction enzyme digestion?

.....

.....

.....

.....

.....

.....

(vi) What are DNA ligases and use of ligases in recombinant DNA technology?

.....

.....

.....

.....

(vii) What is a 'cloning vector'?

.....

.....

.....

.....

(viii) What will be the consequence of not having an origin of replication (ori) in a cloning vector?

.....

.....

.....

(ix) Define following terms associated with cloning vectors.

Multiple cloning site:

Selectable marker:

(x) Mention two major limitations of λ phage cloning vectors.

.....

(xi) Explain how those (above) limitations have been overcome in λ phage cloning vectors?

.....

(xii) What is meant by following terms in genetic engineering?

Transformation:

Competent cells:

(xiii) Mention two methods of making competent cells.

.....

(xiv) A plasmid vector used in a cloning experiment contains ampicillin and chloramphenicol resistant genes. After transformation, bacterial colonies were visible on ampicillin containing medium but not on chloramphenicol containing medium. How would you explain this observation?

.....

(xv) Name three important regions on the *Ti* plasmid of *Agrobacterium tumefaciens*.

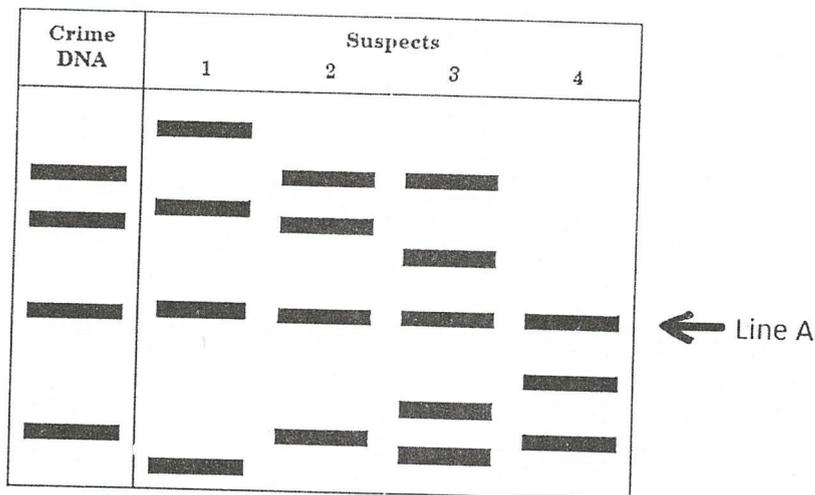

.....

(2). Answer all questions.

- (i) Explain briefly what is gene therapy?
- (ii) Name two methods of transgene delivery in gene therapy.
- (iii) Give three types of viral vectors commonly used in gene therapy.
- (iv) What is RNA- ribozymes? Using a suitable diagram explain the role of RNA-ribozyme in “targeted inhibition of gene expression” during gene therapy treatment.

(3). Answer all questions.

- (i) Explain the major steps of the experimental procedure in DNA fingerprinting.
- (ii) Following figure shows the DNA fingerprint of sperms collected from a raped victim (crime DNA) and four suspects.

- a) Who is the real rapist? Give reasons for your answer.
- b) DNA bands of the line “A” indicated in the figure are identical for all four suspects. What would be the reason/s for that?
