Faculty of Engineering

End-Semester 6 Examination in Engineering: December 2018

Module Number: EE6304 Module Name: Embedded Systems Design

[Three Hours]

[Answer **all questions**, each question carries 10 marks]

Q1 Answer the following questions by referring to the given program in Figure Q1 (a) written in assembly language. This program initiates the PIC ports according to requirement and then power on a light emitting diode (LED) array by connecting push buttons to the PIC 16F877 microcontroller. (Refer the supplementary Figures of Q1 (b) and Q1 (c))

a) Propose a title for the given program in Figure Q1(a). [1 Mark]

b) Draw a flow chart to demonstrate the given program in Figure Q1(a). [2 Marks]

c) Propose appropriate comments and fill the blank spaces shown in the program.(Refer the instructions given in the Table Q1) [4 Marks]

d) Draw the circuit diagram to implement the hardware part by connecting all resources and components. [3 Marks]

Q2 a) Describe general similarities and differences between 16F84A and 16F877 PIC microcontrollers. [2 Marks]

b) Describe the advantages of in-circuit programming and debugging over the corresponding conventional development process. [1 Marks]

c) State the advantages of flash ROM compared to other memory. [1 Marks]

d) State what you understand by the statement "PIC16FXX series microcontrollers are 8-bit Microcontrollers"? [1 Mark]

e) How many bits does the 8k MCU program memory contain? [1 Mark]

f) For the circuit in Figure Q2 what is the purpose of RC circuit that is connected to the RESET input of the microcontroller?

[2 Marks]

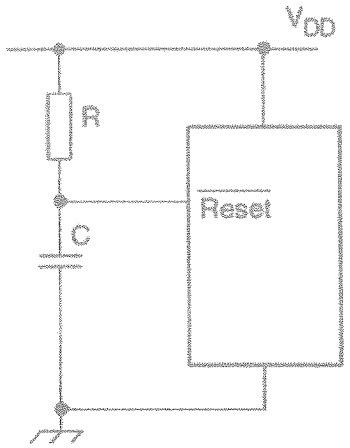

Figure: Q2

g) What is the effect of executing the following instructions?

```
movlw b'11110000'
movwf trisb
```

[2 Marks]

Q3. a) State the difference between a microprocessor and a microcontroller. [1 Mark]

b) Explain why a pull-up resistor is needed with a switch input. [1 Mark]

c) Briefly explain why hardware timers are useful in MCUs. [2 Marks]

d) Explain how a pre-scalar extends the timer period [2 Marks]

e) Explain why the plain 7-segment LED display needs a code table. [2 Marks]

f) Briefly explain the scanning process used to read a keypad button. [2Marks]

Q4. You have been asked to design an embedded system to regulate glucose levels in the body of someone with diabetes by continuously measuring the level of glucose and dispensing doses of insulin based on those measurements. The chemical glucose sensor generates a **4-bit** digital signal. The insulin infusion pump is controlled by a **PWM** signal. The system has an **ON/OFF** switch, a **RESET** switch, alarm speaker and a LCD for blood glucose monitoring. Refer the Figure Q4.

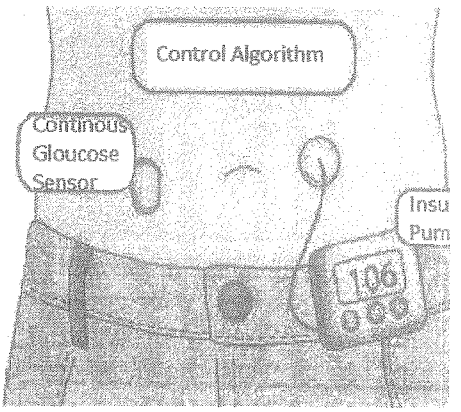

Figure:Q4

a) Show the general layout of the required system. [2 Marks]

b) Give the detailed hardware design of each unit in your design. [3 Marks]

c) Draw a flowchart to demonstrate the operation of such a system?[3 Marks]

d) If the microcontroller has insufficient input/output lines, show how you can interface the LCD serially.

[2 Marks]

Note 1: When an I/O register is modified as a function of itself (e.g., `MOVF PORTB, 1`), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

2: If this instruction is executed on the TMR0 register (and, where applicable, d = 1), the prescaler will be cleared if assigned to the Timer0 Module.

3: If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a `NOP`.

Note 1: The upper byte of the program counter is not directly accessible. PCLATH is a slave register for PC<12:8>. The contents of PCLATH can be transferred to the upper byte of the program counter, but the contents of PC<12:8> are never transferred to PCLATH.

2: The $\overline{TO}$ and $\overline{PD}$ status bits in the STATUS register are not affected by a $\overline{MCLR}$ Reset.

3: Other (non power-up) RESETS include: external RESET through $\overline{MCLR}$ and the Watchdog Timer Reset.

4: On any device RESET, these pins are configured as inputs.

5: This is the value that will be in the port output latch.
